Comparative experimental studies on superior cognitive domains: AI versus humans

Raquel Ayala-Carabajo and Joe Llerena-Izquierdo, Universidad Politécnica Salesiana, Guayaquil, Ecuador

Motivation

This study analyzes the performance of artificial intelligence in processes known as "cognitive" (according to scientific literature) in comparison with the performance of human cognitive processes, analyzing experimental and/or empirical studies.

Method

The PRISMA process and bibliometric analysis were used to identify and analyze relevant research.
A total of 291 studies were analyzed, which were grouped into five categories corresponding to the identified cognitive processes.

Analysis

The results show that only 10.3% of studies report accuracy rates between 90% and 100%, suggesting that AI performs comparably to humans but without achieving absolute efficiency.
The most significant contribution of the study is the comparative relational structure established between human cognitive processes and artificial intelligence processes.
